

OPTIC FUEL CLEAN OF CALIFORNIA

Removes water!

Maintaining Fuel Quality!

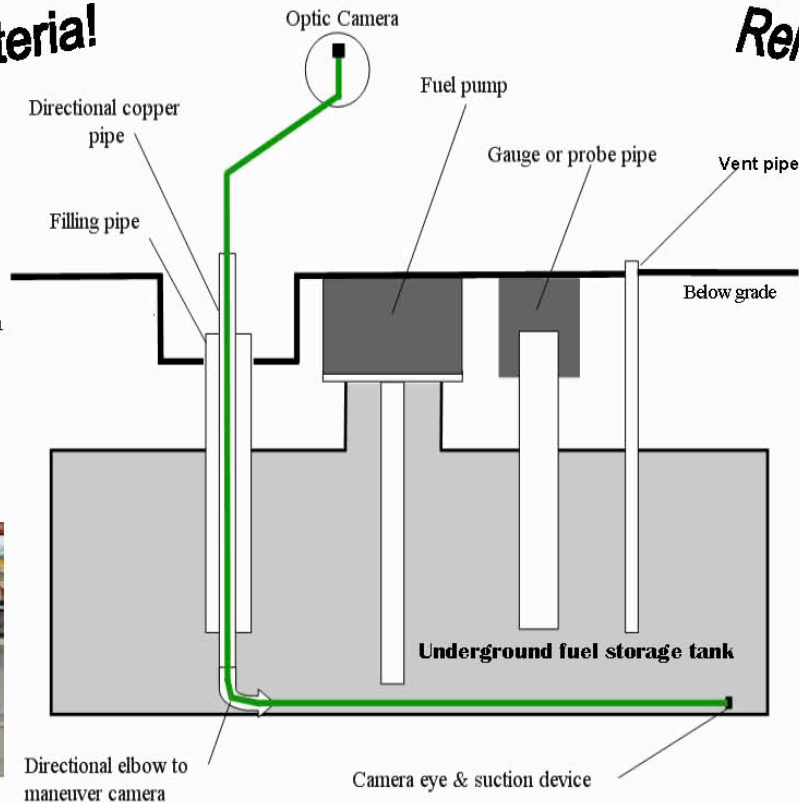

Removes sludge!

Removes bacteria!

Removes contaminants!

As STICO quotes it

“Small amounts of water in fuel handling and storage systems can lead to severe cost consequences and drain retail service station profits.”

Steel Tank Institute on Tank Maintenance

“The primary tank should be inspected monthly for the presence of water. Inspection should take place at the lowest possible points inside the primary tank. Water and sediment in fuel can cause plugging of filters. Also, bacterial growth, originating from the fuel, can cause filters to plug and corrosion of tanks and lines.”

Optic Fuel Clean fiber optically inspects and removes water, loose sludge, bacteria and sediment from fuel in underground and above ground fuel storage tanks. Next, we use a 10 stage filtering process to filter out the contamination and return the good fuel back in the tank only removing unwanted waste. This service was developed and tested in Europe and was brought to the United States in 2002. OFC has been inspecting and cleaning UST's and AST's throughout the greater mid-west with positive response from tank operators. This new type of service visually inspects and cleans the fuel at the same time while your customers continue to pump their fuel. **There is no tank downtime!** Our camera/probe reaches the entire tank bottom, including any low spots where water & bacteria accumulate. What you can't see can cost you in the long run. Be proactive, a major concern is every tank has water. Water can cause phase separation and bring additional oxygen into the tank, with oxygen the bacteria breeds resulting in clogged filters, corrosion, or system failure potentially costing the tank operator many thousands. Approved for all types of fuel. Call us for this new cost effective way to maintain your fuel quality and tanks. Have your fuel fiber optically inspected and cleaned today!
